

Telecommunications Engineering Internship
Byers Engineering Company in Atlanta, Georgia

Students get a complete understanding of inside and outside plant engineering. They are given an interactive opportunity to see how this industry works. They will be able to go to actual field sites and learn how to take field notes, and from that experience apply it to a software portion of the job. The software portion of the job will be drafting the field notes and understanding the engineering that goes into the project. They use applications such as Autocad or Microstation. Please feel free to contact me for further information or a presentation for your students. Thanks for your time.
